J. BIOL. CHEM. 260:3910-3914(1985).

-I- FUNCTION: PROMOTES HYDROLYSIS OF GLYCOGEN AND LIPIDS, AND RAISES THE BLOOD SUGAR LEVYL.

-I- INDUCTION: PRODUCED IN THE A CELLS OF THE ISLETS OF LANGERHANS IN RESPONSE TO A DROP IN BLOOD SUGAR CONCENTRATION.

-I- X'S IN THE SEQUENCE WERE INCLUDED BY HOMOLOGY WITH AMERICAN GOOSEFLES SQUENCES.

-I- SIMILARITY: BELONGS TO THE GLUCAGON FAMILY.

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Stimulating/inhibiting insulin release with exendin polypeptide(s) - for treating diabetes mellitus and preventing hyperglycaemia.
Claim 6; Columns 13-14; 17pp; English.
R80546 is Heloderma suspectum exendin-4. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in) dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Regulating gastrointestinal motility using exendins or their Regulating gastrointestinal motility using exendins or their agonists - for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations claims 20 and 21; Fig 1; 70pp; English.

#47549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (#47608) or exendin-4 (#47609).
                                                                    Heloderma suspectum exendin-4.
Exendin-4; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulitis or disorders of the billary tract or sphincter of oddi), postprandial dumping syndrome and hyperglycaemia oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type I diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gila monster exendin-4.

New Possible V33163.

New nucleic acid encoding proexendin - used to diagnose and treat, new nucleic acid encoding proexendin - used to diagnose and treat, new nucleic acid encoding protection to treat poisoning by reptile venomery e.g. endocrine tumours, also to treat poisoning by reptile venomery claim 3: Fig 2: 26pp; English.

The Heloderma suspectum proexendin peptide is encoded by its cDNA which was isolated from all will suspectum salivary gland cDNA library. The proexendin protein comprises of a novel exendin N-terminal peptide (ENTP) linked to the N-terminus of the exendin A peptide peptide contains of the exendin Proexendin con a ldentify related sequences (e.g. the conding agency defects associated with metabolic disease) and species of the proexendin peptide can be used to raise antibodies. Anti-proexendin peptide can be used to raise antibodies. Anti-proexendin with altered levels of proexendin (e.g. endocrine tumours and organ antibodies are claimed to be useful for diagnosing conditions associated with altered levels of proexendin (e.g. endocrine tumours and organ failure), for identifying other regulators of cell metabolism, in drug squence 87 AA;

Sequence 87 AA;

Exendin; obesity; type II diabetes; eating disorders; cardiac disease;
Insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Regulating gastrointestinal motility using exendins or their agonists for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations claims 20 and 21; Fig 1; 70pp; English.

W447549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (W47608) or exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin agonists, which reduce gastric motility and delay gastric Exendin agonists, can be used to treat spasm (where associated with acute emptying, can be used to treat spasm (where associated with acute oldiverticulitis or disorders of the biliary tract or sphincter of oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type I diabetes, imparised glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendins, components of Gila monster venom, have some sequence similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   investigation, particularly radiological or by magnetic resonance
                                                                                                    Exendin agonist; gastric motility; gastric emptying; treatment; spasm; postprandial dumping syndrome; postprandial hyperglycaemia; type i diabetes; impaired glucose tolerance; toxin ingestion; obesity; Gila monster venom; exendin-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

Reducing food intake by administering exendins or their

Peducing food intake by administering exendins or their

analogues - for treatment of e.g. obesity, type II diabetes,

analogues - for treatment of e.g. obesity, type II diabetes,

callengates and insulin resistance

car alleviated by reducing food intake, in particular obesity, type

I diabetes, eating disorders, insulin resistance syndrome, elevated

comprises administering an exendin or an exendin agonist. The method

consumption as effectively as amylin or cholecystokinin but has a much

longer-lasting cation (still effective after 6 hours in a mouse model).

The present sequence is that of an exendin-4 variant which is one of

the preferred compounds for use in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, analogues - for treatment of e.g. obesity, type II diabetes, cating disorders and insulin resistance cating disorders that a leaves to a new method for treating disorders that the invention relates to a new method for treating disorders that it diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment comprises appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as anylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-30) or its amide which is one of the preferred compounds for use in the method.
WPI; 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Stimulating/inhibiting and preventing hyperglycaemia.

for treating diabetes mallitus and preventing hyperglycaemia.

Claim 1; Columns 13-14; 17pp; English.

RR0543 is the Heloderma suspectum exendin-4 residues 1-31. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin-4 (1-30) for use in treating disorders related to food intake. Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This peptide is a fragment of exendin-4 isolated from Heloderma horridum. This peptide and its salts, esters and derivatives can be wised to treat diabetes mellitus. They stimulate biosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hypoglycaemia. Compared with glucagon-like peptide I (5LPI) and the known exendins, they are more active (effective at lower doses), more stable to degradation and metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                      Stimulating/inhibiting insulin release with exendin polypeptide(s) for treating diabetes mellitus and preventing hyperglycaemia.
Claim 2; Columns 13-14; 17pp; English.
R80544 is the Heloderma suspectum exendin-4 residues 1-31, where the native pro31 has been replaced with a Tyr residue. It is an the native pro31 has been replaced with a Tyr residue. It is an almostropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin (in) dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-DEC-1997.

juucagon, and do not induce hypoglycaemia claim 2; Page 22; 150pp; English.

Peptides w39303-w39304.0 are fragments of exendin-3 and exendin-4 peptides w39304.0 are fragments of exendin-3 and exendin-4 peptides w39304.0 are fragments of exendin-3 and exendin are used in a novel method for the treatment of diabetes mellitus. These peptides can stimulate hisosynthesis and secretion of insulin, but have the opposite effect on biosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not independent. Compared with glucagon-like peptide 1 (GLPI) and the known exendins, they are more active (effective at lower doses), more stable to degradation and metabolism and have a longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-WAR-1999 (first entry)
Exendin-4 (1-28) amide for use in treating disorders related to food.
Exendin: obesity: type II dlabetes; eating disorders; cardiac disease;
Exendin: obesity: type II dlabetes; eating disorders; ardiac disease;
insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      rruncated versions of exendin peptide(s) for treating diabetes - increase secretion and biosynthesis of insulin, but reduce those of

The invention relates to a new method for treating disorders that

C are alleviated by reducing food intake, in particular obesity, type

C if diabetes, earling disorders, insulin resistance, elevated

C plasma glucose levels, or the risk of cardiac disease. The method

C comprises administering an exendin or an exendin agonist. The treatment

C reduces appetite and lowers plasma lipid levels. It inhibits food

C consumption as effectively as amylin or cholecystokinin but has a much

C longer-lasting action (still effective after 6 hours in a mouse model).

C The present sequence is that of exendin-4 (1-28) amide which is one of

S Sequence 28 AN;

"Specific glucagon-related peptides isolated from anglerfish islets
"Specific glucagon-related peptides isolated from anglerfish islets
are metabolic cleavage products of (pre)proglucagon-II.";

PEPTIDES 7:331-339(1986).

-1- FUNCTION: PROMOTES HYRROLYSIS OF GLYCOGEN AND LIPIDS, AND RAISES

-1- FUNCTION: PROMOTED IN THE A CELLS OF THE ISLETS OF LANGERHANS

IN RESPONSE TO A DROP IN BLOOD SUGAR CONCEMPRATION.

-1- SIMILARITY: BELONGS TO THE GLUCAGON FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Frimary structure of glucagon and a partial sequence of
oxyntomodulin (glucagon-37) from the guinea pig.";
REGUL. PEPT. 11:309-320(1985).

I FUNCTION: PROMOTES HYDROLYSIS OF GLYCOGEN AND LIPIDS, AND RAISES
THE BLOOD SUGAR LEVEL.

I FUNCTION: PROMOTED IN THE A CELLS OF THE ISLETS OF LANGERHANS
IN RESPONSE TO A DROP IN BLOOD SUGAR CONCENTRATION.

SIMILARITY: BELONGS TO THE GLUCAGON FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ಗ

THE BLOOD SUGAR LEYEL.

-I FUNCTION: PROMOTES HYDROLYSIS OF GLYCOGEN AND LIPIDS, AND RAISES

INDUCTION: PRODUCED IN THE A CELLS OF THE ISLETS OF LANGERHANS

IN RESPONSE TO A DROP IN BLOOD SUGAR CONCENTRATION.

-I SIMILARITY: BELONGS TO THE GLUCAGON FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
